**COMPUTER HAVING HARD DRIVE LATCHING MECHANISM****FIELD OF THE INVENTION**

5       The present invention relates generally to a computer system having a computer hard drive, and particularly to a system for securing one or more computer hard drives to a computer chassis with a single actuator and without the use of tools.

**BACKGROUND OF THE INVENTION**

10       A computer system is typically comprised of a variety of different devices, such as a monitor, keyboard, and  
15       mouse, connected to a central unit, commonly referred to as the computer. Typically, the computer houses a variety of components within a protective enclosure. For example, a typical computer has one or more hard drives for permanently storing data, such as computer programs. A  
20       typical computer also has a central processing unit, or CPU, that controls the operation of the computer in accordance with the computer programming stored in the hard drive. The computer uses temporary memory, or RAM, to transfer data between the hard drive and CPU. The computer

also has a power supply to supply power to the hard drive,  
CPU and RAM.

Securing mechanisms that do not require the use of a  
5 tool have been used to secure a hard drive to a computer.  
Typically, these mechanisms secure the hard drive with  
guides and an actuator drive, such as a flexible strip with  
a hole. During the installation process, the hard drive is  
inserted into the guides. The flexible strip is flexed out  
10 of its normal position by the hard drive during  
installation. When installed, the flexible strip returns  
to its normal position such that the hole in the flexible  
strip fits over a screw head on the hard drive, preventing  
the removal of the hard drive from the guides. To remove  
15 the hard drive, a force must be applied to bend the  
flexible strip so that it does not obstruct the movement of  
the hard drive and the hard drive can be removed from the  
guides.

20 Therefore, it would be advantageous to have a system  
that would allow a computer hard drive to be installed and  
removed, without the use of tools, with no loose parts

produced, and without the need for a bending force to be applied during the removal of the hard drive.

It also would be advantageous to have a system that could allow more than one computer hard drive to be installed and removed with a single actuator, without the use of tools, and with no loose parts produced.

#### SUMMARY OF THE INVENTION

According to one aspect of the present invention, a computer system having a chassis, a processor, a hard drive securing mechanism, and at least one hard drive is featured. The hard drive securing mechanism is operable to secure one or more hard drives to the chassis with a single actuator. The hard drive is coupled to the processor and secured to the chassis by the hard drive securing mechanism.

According to another aspect of the present invention, a computer hard drive securing system having a chassis, a plurality of guides secured to the chassis, a hard drive carrier and a securing lever is featured. The securing

lever is operable to secure one or two hard drives to the chassis in cooperation with the plurality of guides and the hard drive carrier. The carrier is configured to support a computer hard drive.

5

According to another aspect of the present invention, a method of securing a plurality of hard drives to a computer chassis is featured. The method includes disposing a first hard drive between a first restraint and the securing lever. The method further includes the act of disposing a second hard drive between a second restraint and the carrier. Additionally, the method includes rotating the securing lever to secure the first hard drive and the second hard drive. The first hard drive is secured by the first restraint and the lever, and the second hard drive is secured by the carrier and the second restraint.

10

15

According to another aspect of the present invention, a rotatable lever for securing a hard drive to a chassis is featured. The rotatable lever has a plurality of guides. The guides are configured to receive a protruding member when the securing lever is in a first position and to

20

restrict the protruding member when the securing lever is in a second position.

5

**BRIEF DESCRIPTION OF THE DRAWINGS**

The invention will hereafter be described with reference to the accompanying drawings, wherein like reference numerals denote like elements, and:

10

Figure 1 is a block diagram of a computer system;

15

Figure 2 is a perspective view of a computer chassis having a hard drive latching mechanism securing two hard drives to the chassis with a single actuator, according to a preferred embodiment of the present invention;

Figure 3 is a top view of a computer hard drive;

20

Figure 4 is a perspective view of the computer chassis of Figure 2 with the two hard drives removed;

Figure 5 is a front elevational view of the hard drive latching system of Figure 4, illustrating the installation

of a first hard drive into the hard drive latching mechanism, according to a preferred embodiment of the present invention;

5           Figure 6 is a front elevational view of the hard drive latching system of Figure 5, illustrating the installation of a second hard drive into the hard drive latching mechanism;

10           Figure 7 is a front elevational view of the computer chassis of Figure 6, illustrating two hard drives positioned within the hard drive latching system with the securing lever in an upright position;

15           Figure 7A is an expanded view of the cam of the lever and a curved end of a carrier, taken generally along line 7A-7A of Figure 7;

20           Figure 8 is a front elevational view of the computer chassis of Figure 6, illustrating two hard drives positioned within the hard drive latching system with the securing lever in a horizontal, or secured, position;

Figure 8A is an expanded view of the cam of the lever and a curved end of a carrier, taken along line 8A-8A of Figure 8;

5        Figure 8B is a cross-sectional view illustrating a securing lever, carrier, and a tab, taken along line 8B-8B of Figure 8;

10       Figure 8C is an expanded view of a curved end of a carrier and a hard drive head, taken along line 8C-8C of Figure 8;

10

#### **DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENTS**

Referring generally to Figure 1, a block diagram depicting an exemplary computer system, generally designated by the reference numeral 20, is featured. Computer 20 may be any of a variety of different types, such as a server, desktop computer, or workstation. In the illustrated embodiment, a processor 22 controls the functions of computer system 20. Computer 20 also includes a power supply 24 to supply power to various components within the system 20.

15

20

Various other devices may be coupled to processor 22, depending upon the desired functions of computer 20. For example, a user interface 26 may be coupled to processor 22. Examples of user interfaces 26 include buttons, switches, a keyboard, a light pen, a mouse, and/or a voice recognition system. A display 28 may also be coupled to processor 22. Examples of displays 28 include: a television screen, a computer monitor, LEDs, or even an audio display. Additionally, a communications port 32 may be coupled to processor 22. Communications port 32 may be adapted to be coupled to a peripheral device 34, such as a printer, a computer or an external modem.

Typically, processor 22 utilizes programming to control the operation of computer 20. Memory is coupled to processor 22 to store and facilitate execution of the programming. In the illustrated embodiment, processor 22 is coupled to a volatile memory 36 and two hard drives utilized as non-volatile memory. The present hard drive latching system, discussed below, is particularly amenable to securing two hard drives. Non-volatile memory 38 also may include a high capacity memory such as a disk or tape drive memory. Non-volatile memory 38 may include a read

only memory (ROM), such as an EPROM, to be used in conjunction with volatile memory 36. A variety of memory modules, such as DIMMs, DRAMs, SDRAMs, SRAMs, etc. also may be utilized as volatile memory 36 for a given device.

5

Referring generally to Figure 2, an exemplary embodiment of a hard drive latching system 40 is illustrated. In the illustrated embodiment, hard drive latching system 40 can secure one or two hard drives. As best illustrated in Figure 3, each hard drive 42 has a plurality, e.g. four, support members 44, such as screws threaded into the body 46 of the hard drive. Each screw 44 has an extending head 48. Each hard drive 42 also has a power connector 50 for coupling power to the hard drive and a data connector 52 for transferring data to and from hard drive 42.

10

15

20

Referring again to Figure 2, the illustrated embodiment of hard drive latching system 40 can be operated to secure one or two hard drives. Hard drive latching system 40 includes a plurality of tabs formed in chassis 56, a carrier 58, and a securing lever 60.

In the illustrated embodiment, chassis 56 is formed of sheet metal. The tabs are formed by cutting patterns in sheet metal portions of chassis 56 and performing a series of bending operations to shape the tabs. The tabs are used  
5 to restrict and guide the movement of the hard drives, carrier 58 and securing lever 60. Rather than forming a plurality of tabs, a separate guide assembly may be constructed and secured to chassis 56 to perform the same function as the plurality of tabs. Additionally, a single  
10 device may be used where multiple tabs are used in consort.

Two first tabs 64 are used to secure a first hard drive 66. Each first tab 64 has a securing notch 68. Securing notch 68 is shaped to restrict motion of heads 48  
15 on a first hard drive 66. Each first tab 64 also has an inclined leading edge 70 to direct a head 48 into proper position in notch 68.

Two second tabs 72 are used to secure carrier 58 and  
20 lever 60 to chassis 56. Each second tab 72 has a hole 74 therethrough. In the illustrated embodiment, securing lever 60 has a pin 76 at each end. Securing lever 60 is secured by inserting each pin 76 into a corresponding hole

74 in each second tab 72. The holes 74 and pins 76 allow securing lever 60 to rotate smoothly from an upright to a horizontal position. Each second tab 72 also has a notch 78. Each notch 78 guides a first pin 80 on carrier 58

5

A third tab 82 is used to secure lever 60. Third tab 82 is shaped to form a catch 84. Lever 60 includes a pin 86 disposed at the end of a flexible member 88. When lever 60 is in the horizontal, or secured position, catch 84 restricts the movement of pin 86.

10

Two fourth tabs 90 and two fifth tabs 92 are used with second tabs 72 to slidably secure carrier 58 to chassis 56. Each fourth tab 90 has a notch 94 that directs the movement of a second carrier pin 96 on carrier 58. As best illustrated in Figure 4, carrier 58 also includes two guide rods 98 secured to mounts 100 on carrier 58. Each of the fifth tabs 92 has a notch 102 to direct guide rods 98 as carrier 58 is moved. A spring 104 is inserted over each guide rod 98 between each fifth tab 92 and mount 100. Springs 104 bias carrier 58 towards securing lever 60.

15

20

Referring again to Figure 2, two sixth tabs 106 are used with carrier 58 to secure a second hard drive 108. Each sixth tab 106 has a notch 110 to restrict motion of a head 48 on second hard drive 108. Each sixth tab 106 also has an inclined edge 112 to direct second hard drive 108 into proper securing position.

Carrier 58 has two guide rails 114 along sides 116 of carrier 58. Each guide rail 114 supports a head 48 on second hard drive 108. Each guide rail 114 includes a curved end 118 configured to restrict a head 48 on second hard drive 108 when the latch mechanism is operated. Carrier 58 also has a curved end 120 configured for engagement with lever 60. Curved end 120 also has a flat portion 121.

Securing lever 60 has an actuator end 122 and a distal end 124 connected by a rod 126. Actuator end 122 and distal end 124 have a cam 128 configured for sliding engagement with curved end 120 of carrier 58 and a flat portion 129 configured to engage flat portion 121 of curved end 120 when lever 60 is in a vertical position, thus acting to stop further movement of lever 60 past vertical.

Cam surface 128 forces curved end 120 towards fifth tabs 92 as lever 60 is rotated counterclockwise from an upright to a horizontal position.

5           Actuator end 122 and distal end 124 each include a tapered notch 130. Each tapered notch 130 is designed to guide a head 48 of first drive 66 into a proper position in securing lever 60. Each tapered notch 130 is configured so that heads 48, hole 74, and pin 76 are aligned along an  
10           axis 131. Lever 60 also includes a tab 132 to facilitate manual rotation of lever 60.

Referring generally to Figures 5 through 9, the process of securing hard drives 66 and 108 in chassis 56 is  
15           illustrated. Referring generally to Figure 5, first hard drive 66 is initially positioned with first heads 134 of heads 48 inserted into notches 68 of first tabs 64 to install first hard drive 66 in latching system 40. First hard drive 66 is then pivoted towards securing lever 60, as  
20           referenced by arrow 135, such that second heads 136 of heads 48 are inserted into tapered notch 130. The taper of each notch 130 guides each heads 136 into position.

Referring generally to Figure 6, to install second hard drive 108 into hard drive latching system 40, second hard drive 108 is initially positioned with leading heads 138 of heads 48 inserted into notches 110 of sixth tabs 106. Second hard drive 108 is then pivoted towards carrier 58, as referenced by arrow 139, such that trailing screw heads 140 of heads 48 are placed on rail 114.

Referring generally to Figure 7, to secure hard drives 66 and 108, lever 60 is rotated from the upright position to a horizontal position, as referenced by arrow 141. As best illustrated in Figure 7A, second heads 136 are unsecured by lever 60 when lever 60 is in the upright position. At this stage, hard drive 66 may be lifted and removed from hard drive latching system 40.

Referring generally to Figures 8 and 8A, hard drives 66 and 108 are secured in hard drive latching system 40 when lever 60 is in the horizontal position. As best illustrated in Figure 8A, each tapered notch 130 of lever 60 is rotated about a respective second head 136 as lever 60 is rotated from the upright position to the horizontal position. Thus, first and second heads 134 and 136 are

secured between notches 68 on first tabs 64 and tapered  
notches 130 on lever 60. Pin 86 on flexible member 88 is  
captured by catch 84 on third tab 82 when lever 60 rotated  
to the horizontal position. Tab 132 is provided for an  
5 operator to easily manipulate lever 60.

As illustrated in Figure 8A, cam 128 of lever 60  
slidingly engages curved end 118 of carrier 58 as lever 60  
is rotated counterclockwise. The shape of cam 128 causes  
10 carrier 58 to be driven linearly to the right, in this  
view, as illustrated by arrow 142. A top view of the  
orientation of carrier 58, lever 60, and second tabs 72 at  
the point of engagement is illustrated in Figure 8B.

Referring again to Figure 8, the rotating motion of  
cam 128 is translated into linear motion of carrier 90 as  
lever 60 is rotated counterclockwise. The linear motion of  
carrier 60 to the right compresses springs 104. As best  
illustrated in Figure 8C, curved ends 118 of carrier 58  
20 move against trailing heads 140 of second hard drive 108 as  
carrier 58 is moved to the right by lever 60. Leading and  
trailing heads 138 and 140 are secured between notches 110

on sixth tabs 106 and curved ends 118 of carrier 58 with lever 60 in the horizontal position.

To remove a hard drive, lever 60 is rotated in a clockwise direction. When lever 60 is in an upright, or unsecured position, heads 136 are no longer restrained by tapered notch 130. Thus, first hard drive 66 can be removed from hard drive latching system 40. Additionally, cam 128 is moved towards the left as lever 60 is rotated clockwise. Compressed springs 104 drive carrier 58 to the left, against cam 128, as lever 60 is rotated clockwise. As carrier 58 moves to the left, curved ends 118 also move to the left. Curved ends 118 do not restrain heads 140 when lever 60 is in a fully upright position. At this stage, second hard drive 108 may be removed from system 40.

Referring generally to Figure 9, a moveable shelf 143 may be used as a part of chassis 56. Shelf 143 may be used to secure a printed circuit board or some other component. In the illustrated embodiment, shelf 143 is hinged such that it may be lowered over first hard drive 66. Shelf 143 is disposed over tab 132 of lever 60 such that lever 60 can not be rotated clockwise to the upright, or unsecured,

position. Thus, assisting hard drive latching system 40 secure the hard drives to chassis 56. Additionally, shelf 143 may not be lowered over hard drive 66 unless rotatable lever 60 is in the horizontal, or secured, position. Thus, shelf 143 acts as a second check to ensure that rotatable lever 60 is in the secured position, securing the hard drives to the chassis, before a assembly of the enclosure cover is completed.

In Figures 10 and 11, front and rear views of actuator end 122 of securing lever 60 are illustrated. In Figure 12, hard drive latching system 40 is illustrated as securing a single hard drive 42 to the chassis. An additional hard drive may be added at a later time.

Referring generally to Figure 13, an exemplary embodiment of a hard drive latching mechanism 144 for securing a single hard drive to the chassis is featured. The operation of hard drive latching mechanism 144 is similar to the operation of hard drive latching mechanism 40. In the illustrated embodiment, a securing lever 146 and a plurality of tabs are used to secure a hard drive 42

to chassis 56. Alternatively, a securing lever 146 and a carrier can be used to secure a single hard drive 42.

It will be understood that the foregoing description is of preferred exemplary embodiments of this invention, and that the invention is not limited to the specific forms shown. For example, devices other than tabs formed in the chassis may be used to restrict the movement of the screw heads of the hard drives, or guide the hard drives.

Additionally, a single device secured to the chassis may serve the same purpose as a plurality of tabs.

Furthermore, the tabs may be used to restrict the movement of screw heads attached to the hard drive or to fixed portions of the hard drive. These and other modifications may be made in the design and arrangement of the elements without departing from the scope of the invention as expressed in the appended claims.

CLAIMS

What is claimed is:

1. A computer system, comprising:

5

a chassis;

a processor;

10

a hard drive securing mechanism, the hard drive  
securing mechanism being operable to secure  
a plurality of hard drives to the chassis  
with a rotatable lever; and

15

at least one hard drive secured by the hard drive  
securing mechanism.

2. The system as recited in claim 1, wherein each  
hard drive includes a plurality of protruding members,  
further wherein the hard drive securing mechanism is  
operable to secure the plurality of hard drives by  
5 restricting the movement of the plurality of protruding  
members.

3. The system as recited in claim 1, the hard drive  
10 securing mechanism further comprising:

a plurality of guides secured to the chassis to  
restrict the movement of the plurality of  
protruding members; and

15 a hard drive carrier,

wherein the rotatable lever includes a plurality  
of tapered guides, each tapered guide being  
20 configured to receive and secure a  
protruding member.

4. The system as recited in claim 2, wherein a first hard drive is securable between the lever and a first set of guides.

5 5. The system as recited in claim 3, wherein each tapered guide is configured to receive a protruding member when the rotatable lever is in a first position, further wherein, each tapered guide is configured to prevent movement of a protruding member when the lever is in a  
10 second position.

6. The system as recited in claim 5, wherein the rotatable lever includes a protrusion biased by a flexible  
15 member, further wherein the protrusion is captured when the securing lever is disposed in the second position.

7. The system as recited in claim 3, wherein a  
20 second hard drive is securable between the hard drive carrier and a second set of guides.

8. The system as recited in claim 3, wherein the rotatable lever is operable to drive the carrier towards the second set of guides.

5

9. The system as recited in claim 8, wherein the rotatable lever comprises a cam configured for sliding engagement with the carrier.

10

10. The system as recited in claim 9, further comprising a spring, wherein the spring is compressed as the rotatable lever is rotated in a first direction, further wherein the spring biases the carrier towards the rotatable lever when the rotatable lever is rotated in a second direction.

15

11. The system as recited in claim 3, wherein the rotatable lever comprises a tab for operating the rotatable lever.

20

12. The system as recited in claim 5, wherein the  
rotatable lever comprises a stop that engages a surface on  
the carrier to prevent rotation of the rotatable lever past  
the first position as the rotatable lever is rotated in the  
5 second direction.

13. The system as recited in claim 12, comprising a  
moveable obstruction disposable over the rotatable lever,  
10 wherein when the moveable obstruction is disposed over the  
rotatable lever, the moveable obstruction prevents the  
rotatable lever from rotating from the second position to  
the first position, and further wherein, when the rotatable  
lever is disposed in the first position, the rotatable  
15 lever prevents the moveable obstruction from being disposed  
over the rotatable lever.

14. A hard drive securing system, comprising:

a plurality of guides secured to a chassis;

5 a hard drive carrier held by a first plurality of  
guides and configured to support a computer  
hard drive; and

10 a securing lever mechanism operable to secure the  
plurality of hard drives to the hard drive  
carrier.

15 15. The system as recited in claim 14, wherein the  
securing lever mechanism has a guide portion configured to  
receive a portion of a hard drive when the securing lever  
mechanism is in a first position.

20 16. The system as recited in claim 15, wherein a  
first hard drive is secured when the securing lever  
mechanism is rotated to a second position.

17. The system as recited in claim 16, wherein the securing lever mechanism is operable to rotate from the first position to the second position.

5

18. The system as recited in claim 17, wherein the securing lever mechanism comprises a latch to secure the securing lever when the securing lever is in the second position.

10

19. The system as recited in claim 18, wherein the securing lever is configured with a cam to drive the hard drive carrier as the securing lever mechanism is rotated from the first position to the second position.

15

20. The system as recited in claim 19, comprising a spring, wherein the spring opposes movement of the hard drive carrier produced by the securing lever mechanism and drives the carrier as the securing lever mechanism is rotated from the second position to the second position.

20

21. The system as recited in claim 20, wherein the hard drive carrier is configured to secure a second hard drive against a second plurality of guides when the securing lever mechanism is in the second position.

5

22. A method of securing a plurality of hard drives to a computer chassis, comprising:

10

disposing a first hard drive between a first restraint and a securing lever;

15

deploying a second hard drive between a second restraint and a carrier configured to direct the movement of the second hard drive; and

20

rotating the securing lever to simultaneously secure the first hard drive by the first restraint and the lever and the second hard drive by the carrier and the second restraint.

23. The method as recited in claim 22, further  
comprising:

providing each hard drive with a plurality of  
protruding members.

5

24. The method as recited in claim 23, further  
comprising:

10

configuring the securing lever with a tapered  
guide to receive a first plurality of  
protruding members in a first position of  
the securing lever and to restrict movement  
of the first plurality of protruding members  
in a second position of the securing lever.

15

25. The method as recited in claim 22, further  
comprising:

configuring the securing lever with a cam surface  
to drive the carrier in a first direction as  
the securing lever is rotated from a first  
position to a second position.

26. The method as recited in claim 25, further  
comprising:

providing the chassis with a spring mechanism  
configured to oppose the movement of the  
carrier by the securing lever; and

using the spring mechanism to bias the carrier  
against the securing lever as the securing  
lever is rotated from the second position to  
the first position.

27. The method as recited in claim 22, further  
comprising:

forming the restraints by cutting and bending a  
5 portion of the chassis to form a plurality  
of tabs, each tab configured to restrict the  
movement of a protruding member.

10 28. A rotatable lever for securing a hard drive,  
having a plurality of protruding members, to a chassis,  
comprising:

a plurality of guides, each guide being  
15 configured to receive a protruding member  
when the securing lever is in a first  
position and to restrict the protruding  
member when the securing lever is in a  
second position.

20

29. The rotatable lever as recited in claim 28,  
further comprising

a first portion including at least one of the  
plurality of guides;

a second portion including at least a second of  
the plurality of guides and an operator; and

a connector, connecting the first and second  
portions.

30. The rotatable lever as recited in claim 29,  
wherein the first portion and second portion include a cam  
surface.

31. The rotatable lever as recited in claim 30,  
wherein each guide is tapered.

ABSTRACT OF THE DISCLOSURE

A computer system having a hard drive securing system.  
The hard drive securing system is operable to secure one or  
more hard drives to a chassis with a single operator. The  
5 hard drive securing system uses a plurality of hard drive  
guides, a hard drive carrier, and a securing lever to  
secure a plurality of hard drives to a chassis without the  
use of tools.

## DECLARATION

SOLE/JOINT INVENTOR  
ORIGINAL/SUBSTITUTE/CIP

As a below named inventor, I hereby declare that: my residence, post office address, and citizenship are as stated below next to my name. I believe I am the original, first, and sole inventor (if only one name is listed below) or a joint inventor (if plural inventors are listed below) of the subject matter which is claimed and for which a patent is sought on the invention entitled:

**COMPUTER SYSTEM HAVING HARD DRIVE LATCHING MECHANISM**

as described in the specification ☒ attached or ☐ of patent Application Serial No. \_\_\_\_\_  
filed \_\_\_\_\_ and amended on \_\_\_\_\_

I hereby state that I have reviewed and understand the contents of the above identified specification, including the claims, as amended by any amendment referred to above; that I do not know and do not believe the same was ever known or used in the United States of America before my or our invention thereof, or patented or described in any printed publication in any country before my or our invention thereof or more than one year prior to this application; that the invention has not been patented or made the subject of an inventor's certificate issued before the date of this application in any country foreign to the United States of America on an application filed by me or my legal representative or assigns more than twelve months prior to this application; and that I acknowledge the duty to disclose information of which I am aware which is material to the examination of this application in accordance with Title 37, Code of Federal Regulations § 1.56(a). Such information is material when it is not cumulative to information already of record or being made of record in the application, and

- (1) it establishes, by itself or in combination with other information, a prima facie case of unpatentability of a claim; or
- (2) it refutes, or is inconsistent with, a position the applicant has taken or may take in:
  - (i) opposing an argument of unpatentability relied on by the Office, or
  - (ii) asserting an argument of patentability.

I hereby claim foreign priority benefits under Title 35, United States Code § 119 of any foreign application(s) for patent or inventor's certificates listed below and have also identified below any foreign application(s) having a filing date before that of the application(s) on which priority is claimed:

COUNTRY	APPLICATION NUMBER	DATE OF FILING	PRIORITY CLAIMED UNDER 35 USC 119
			<input type="checkbox"/> YES <input type="checkbox"/> NO

I hereby claim the benefit under Title 35 United States Code § 120 of any United States application(s) listed below and, insofar as any subject matter of any claim of this application is not disclosed in the prior United States Application, I acknowledge the duty to disclose material information as defined in Title 37, Code of Federal Regulations § 1.56(a) which occurred between the filing date of the prior application and the national PCT international filing date of this application:

I hereby declare that all statements made herein of my own knowledge are true and that all statements made on information and belief are believed to be true; and further that these statements were made with the knowledge that willful false statements and the like so made are punishable by fine or imprisonment, or both, under Section 1001 of Title 18 of the United States Code and that such willful false statements may jeopardize the validity of the application or any patent issued thereon.
